                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Hexapeptide #13 binds anti-Ad5 fibre head MAb 7A2.7.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              AAW75290 standard; peptide;
                                                                                                                                                 attachment of the virus to the receptor. The immobilised antibody is incubated with a hexapeptide expression library and peptides bound to the immobilised antibody are eluted by competitive binding with recombinant fragments of the viral surface protein. In a reverse method, the viral surface protein is immobilised and incubated with the peptide library. In this case, the bound peptides are eluted by competitive binding with the monoclonal antibody. The hexapeptides AAW7528-W7529 represent peptides isolated by biopanning the library with the immobilised monoclonal antibody (MAb) 7A2.7 and eluted using an adenovirus type 5 fibre head protein (AAW75267) represent matched are need to identify pentides from MHC Class I and/or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          02-FEB-1999

It is a selective synthesised by standard solid-phase methods. It is a selective inhibitor of mammalian ribonucleotide reductase and can be used to control abnormal cell proliferation. The inhibitor has relatively low toxicity and can be applied topically or systemically. See also AAR06487-R06488, AAR07650-R07655 and AAR07657.

    Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Score

'-- FUNCTION: NEUROEXCITATORY PEPTIDE: INCREASES THE IMPULSE FREQUENCY
NEURON (PON); ALSO ENHANCES THE AMPLITUDE AND FREQUENCY OF THE
HEART BEAT. HAS ALSO AN EFFECT ON SEVERAL OTHER MUSCLES.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          molecule and phosphoric acid groups in the masking group and between the fluorescent and masking groups. The invention also describes peptide derivatives of formula [Al-X-A2], especially composed of 3-42 amino acids; X = amino acid residue comprising phosphoric acid residue; Al. A2 = (optionally protected) amino acid residue, (optionally protected) peptide chain, one comprises a masking group at the terminal or side chain and the other has a self fluorescent group capable of being masked with the intramolecular masking group. The peptides are useful for determining protein phosphatase activity by the changes of intensity of fluorescence. The fluorescent peptides are stable reagents for sensitive and rapid determination of protein phosphatase activity in crude sample even contaminated sample containing phosphoric acid ion.
                                                                                        Cytotoxic T lymphocytes from malaria-exposed Gambian individuals with HLA-B17 showed significant lysis of a large pool of peptides (AAR87287-R87299) derived from Plasmodium falciparum liver stage antigen-1. These peptides will be useful in a malaria vaccine.
                                                                  Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                     Liver stage antigen; LSA-1; human leucocyte antigen; HLA; class HLA-B17; epttope; malaria; vaccine; CTL induction; cytotoxic T lymphocyte.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention relates to methods for producing plants resistant to geminivirus, involving introducing a geminivirus replication associated protein (Rep)-iteron antagonist into a plant. The antagonist is a nucleotide sequence of a geminivirus iteron capable of binding to a Rep protein or a defective Rep which has a conserved geminivirus iteron binding site. The present sequence is a geminivirus Rep peptide

Band 3 is a ubiquitous anion-exchange CC protein and ages as cells and trissues age. Antibodies have been developed CC dears in cld cells and trissues age. Antibodies have been developed CC band 3 in old cells (aging antigenic sites) but not middle aged or young CC cells. This can be used for detecting Alzheimer's disease. A tissue CC disease is treated with an antibody that can differentiate between the CC Alzheimer's (aged) and normal band 3, under complex-forming conditions CC and detecting any complex formed. A tissue containing band 3 from a healthy control is treated in a similar manner and the amounts of complex formed are compared. A significantly greater formation of complex in the CC suspect sample as compared with that of the control is indicative of Alzheimer's disease. The disease can also be detected by comparing the CC degrees of phosphorylation of band 3 or its degradation products in Suspect and control samples. A significant decrease in phosphorylation of complex of the suspect and control samples. A significant decrease in phosphorylation of complex of the suspect sample indicates Alzheimer's disease.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           epitope were isolated by screening phage peptide display libraries with antibodies to L2/HNKI. The present sequence is the homologous region between consensus sequences of minic peptides isolated by different antibodies. The peptides may be used for enhancing memory and for treating Alzhelmer's disease or dementia. They may also be used for treating apoptosis, necrosis, Parkinson's disease, multiple sclerosis and acute and chronic spinal cord injury.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention relates to L2/HNK1 carbohydrate epitope minate peptides. The L2/HNK1 epitope is predominantly expressed on 91ycolipids and 91ycoproteins from nervous tissue. Peptides that mimic the L2/HNK1.
